

**RATIONALE FOR MINERAL ESTATE
CONVEYANCE/RETENTION
WITH SURFACE ESTATE
Supplement to the Mineral Potential Report
Revised 05/06/2005**

A detailed mineral potential report for the BLM parcels involved in the Emerald Mountain Land Exchange proposal was completed in January of 2004. An addendum to this report to include eleven additional parcels was completed in August of 2004. In addition to a mineral potential report, a minerals management efficiency and accessibility assessment of BLM mineral estate was also completed in March of 2005. The following table is a result of that assessment with recommendations for retention or conveyance of the mineral estate.

It is BLM's desire to minimize split estate where split estate may decrease management efficiency. This addendum also tries to honor as much as possible the recommendations of the Mineral Potential Report, realizing the report did not look at mineral ownership patterns and sizes. The Mineral Potential Report recommends that parcels encumbered with leases and parcels having a moderate to high potential for minerals should have the mineral estate retained. It is the wish of this office that parcels encumbered with leases but rating low potential, parcels with locatable minerals rated at moderate potential, and parcels with moderate potential for saleable minerals have the mineral estate conveyed to reduce the amount of split estate. Locatable minerals have no monetary value to the government and saleable minerals are a discretionary action, requiring surface owner approval. Five parcels have a moderate rating for geothermal energy. The mineral estate on these parcels is recommended for mineral conveyance due to their isolation and small size. After conferring with the Colorado State Office, it was decided that the minerals could be conveyed with proper precautions. The minerals on the leased parcels can be conveyed with conditions attached to the title that will honor the terms and conditions of the lease. The BLM as the lessor will also have appropriate protection.

In the case where a parcel is completely surrounded by similar federal mineral estate, it is recommended to retain the minerals regardless of the mineral potential. The rationale is that the BLM does not want to create holes in contiguous mineral estate which would complicate future management of minerals by restricting access, complicating potential royalty issues and/or causing drainage situations. In the case where conveying mineral estate would have left an isolated federal mineral parcel (such as a tip of a peninsula), it is also recommended to retain the mineral estate to prevent the isolation of this federal mineral parcel from possible future access for development. Conveyance of this type would also decrease management efficiency. In the case where a BLM parcel is completely surrounded by private mineral estate and of sufficiently small size (< 81 acres), conveyance of mineral estate is recommended regardless of potential ranking or lease encumbrances. Where federal mineral estate of a particular type is completely surrounded by federal mineral estate of another type, creating islands, the part of the mineral estate that is anomalous to the surrounding estate is recommended for conveyance when the mineral potential is rated as low. For example, when a parcel is completely surrounded by federal coal only and other mineral (including oil & gas) potential is rated as low or moderate, it is preferred that the federal coal mineral estate be retained and the rest the mineral estate be conveyed to the participant. This will keep the federal coal estate blocked

up but eliminate islands of anomalous mineral estate and help reduce split estate issues which have become increasingly cumbersome in recent years.

Less clear cut situations also exist. Where BLM parcels, with low potential, are located on the boundary of a block of mineral estate (having only partial contiguous federal mineral estate) and the parcels are not critical for access to the federal mineral estate, conveyance is also recommended in the interest of eliminating as much split estate as possible. This situation is true for parcels which border all federal minerals as well as partial federal mineral estate. However, in the cases where the mineral potential is moderate or high, and already leased for these minerals, it was decided to retain the minerals to facilitate more efficient management of a mineral resource that is more likely to be developed. This is especially the case in parcels 80, 81 and 84 which are scheduled to be mined in the near future.

There are 129 BLM parcels totaling 15,621.04 acres (all with federal minerals) involved with this land exchange. All together there are fifty-eight parcels (5,826.27 acres) where all of the federal mineral estate is recommended for conveyance and fourteen parcels (4,333.42 acres) where retention of all the federal mineral estate is recommended. There are fifty-seven parcels (5,461.35 acres) recommended for retention of the coal mineral estate only. No high potential minerals were recommended for conveyance. Only ten parcels where mineral potential is moderate was that mineral commodity recommended for conveyance due to their isolation from a larger similar mineral estate, difficult access (lack of existing roads and/or surrounded by private surface), and because of their small size.
